

Group Project: Web Application Security Assessment

1. Group Formation

- **Team Size:** Form a group of exactly **three (3) members**.
- **Registration:** Once your team is finalized, the Group Leader must post the **Group Name, Leader's Name, and Member Names** in the comment section below for official recording.

2. Application Selection

You are provided with four (4) target web applications for this project:

1. **Perpustakaan** (Library Management)
2. **Cafe** (Ordering System)
3. **Car** (Rental/Sales System)
4. **Money Tracker** (Financial Management)

Note: You are encouraged to install and explore all four applications to understand their environments, but you must select **only one (1) application** for your final security assessment.

3. Assessment Scope

Your group must perform a comprehensive security audit of the chosen application. You may choose one or both of the following methodologies:

- **Static Analysis (Code Review):** Manually auditing the source code to find insecure coding practices.
- **Dynamic Analysis (Penetration Testing):** Actively testing the running application for exploitable vulnerabilities (e.g., SQLi, XSS, Insecure Authentication).

4. Deliverables

Upon completion, the group must submit a **Security Assessment Report**. This report should be detailed and include:

- **Executive Summary:** An overview of the application's overall security posture.
- **Vulnerability Findings:** For each bug found, include a description, severity level (High/Medium/Low), and evidence (screenshots of the exploit).
- **Remediation:** Provide specific recommendations or code patches to fix the identified flaws.

Project Timeline & Submission

- **Format:** PDF Report.
- **Submission:** MS Team
- **Due Date:** Week 14
